

Bag to Bin Segregation

Waste segregation in a healthcare or clinical setting is crucial to limiting the risk of a potentially infectious disease spreading. It is therefore important to ensure that once waste has been segregated correctly and packaged, it is also stored correctly prior to collection and disposal.

It is therefore **non-compliant** to mix wastes in the same storage bins and if this happens, due to the contamination risk; waste must be treated at the higher risk category (which is more expensive and detrimental to the environment).

IF THE WASTE IS SEGREGATED INTO DIFFERENT BAGS THEN THE BAGS MUST BE SEGREGATED INTO DIFFERENT BINS.

WHAT NOT TO DO
